**ABSTRACT TITLE: "Dr. Desarda's open repair of inguinal hernia without mesh using absorbable continuous sutures-A video demonstration"**

**AUTHORS / PRESENTERS: PROF. DR.DESARDA M.P.**

**INSTITUTION / HOSPITAL: Poona Hospital and Research centre**

**ASIA PACIFIC HERNIA CONGRESS & LIVE WORKSHOP: 6 – 8 October 2006 New Delhi [India]**

**INTRODUCTION:** Use of the mesh and non absorbable interrupted sutures has become the hallmark for groin hernia repairs to avoid the recurrences. But today, the recurrence free inguinal hernia repair with continuous absorbable sutures is no longer a dream but a reality.

**METHODS:** The author has operated on 177 patients having 200 hernias with continuous sutures using PDSII no.1 (Monofilament Polydioxanone violet, Ethicon) absorbable suture material during last 2 years (2004 & 2005). An un-detached strip of the external oblique aponeurosis (EOA) is sutured to the inguinal ligament below and the muscle arch above, behind the cord, to form a new posterior wall. External oblique muscle gives additional strength to the weakened muscle arch to keep this strip physiologically dynamic.

**RESULTS:** Mean patient age was 52.07 years (range, 18 – 88). All the patients were operated under local or regional anesthesia. 165 (93.2%) patients were ambulatory with limited movements in 6-8 hours and free movements in 18-24 hours. 166(93.7%) patients had a hospital stay of one night and 171(96.6%) patients returned to normal activities within 1-2 weeks. One patient had wound oedema, which subsided on its own. Follow-up was completed in 170 (96%) patients by clinical examination or questionnaire. The median follow-up period was 2.1 years (range, 8-32 months). There was no recurrence of the hernia or postoperative neuralgia.

**CONCLUSIONS:** Results of this series of repairs done with continuous absorbable sutures are comparable with the results of the previously published author's series of repairs done with non absorbable sutures. Dream of doing recurrence free inguinal hernia repair with continuous absorbable sutures, leaving no foreign body in side the patient, may become a reality in future.
